Pack—72 Cards.

Number of Players—Two to four per deck. Any number may play by adding more decks.

Dealing—Deal all the cards one at a time into stacks face down on the table. Players must not look at their cards.

Object of the Game—To make numbers by addition, subtraction, multiplication or division collectively or severally, and to win all the cards possible.

The Play—Players agree on a certain number to be made. Dealer leads the play by laying the top card of his stack face up in the middle of the table. Each player plays in turn, until a player who can make the agreed number calls it and explains his method. The first player to call the number wins all the cards used in his method and places them face downward under his pack. A card may be used or calculated but once.

If he cannot explain how he made the number correctly he pays a penalty by giving one of his cards to each of the other players.

Example of the Play—Twenty has been agreed upon as a number to form. The following cards have been played into the center of the table: 6—3—12—10—7. Method of explanation: Three times six equals eighteen; twelve minus ten equals two; eighteen plus two equals twenty.

The first player to call twenty and give the above explanation wins the cards, six, three, twelve and ten. It is not necessary to use all the cards on the table. Pencils are not allowed. It must be mental work.

Another Example of the Play—The agreed number is twenty-five. 8—5—7—2—5 are played. Five times five equals 25. The cards won are the two fives. The other cards remain on the table and play is continued.

The Winner—When any one player is out of cards the game ends. The winner is the player holding the most cards in his stack.

SNIPPET

Deal each player five cards. Hold them in hands. Place remainder of the pack face down and after each play draw one card from top of pack. Dealer announces the number to be made, say 50, and plays a card, say 8. The next player lays a five on the eight and says eight-fives are forty. Third player lays a two on top and says forty plus two is 42. Fourth player lays a seven on top and says 42 divided by seven is six. The next player lays an eight on top and says six times eight is 48. The next player lays a two on top and says 48 plus two is fifty. He wins the stack of cards played, and scores fifty. The cards won are shuffled and placed on the bottom of the drawing pile. The winner is the one player who first reaches two hundred and fifty.
